

Release 19.17

September 25, 2019

Template Builder

Field Logic 'setValue' doesn't work when setting the value of a phone widget using the value of another phone widget.

Set Value As logic operator now has the ability to set the value of Phone Number widgets.

MV2 - New Features

Pre-fill

The purpose of Pre-fill is to provide a simple method for populating landing pages with stored data. Initially, population of 'Person' records on configured landing pages is supported. Data records for Pre-fill are created by uploading a CSV template in your personal settings or by manually filling fields on landing pages. More information on this feature will be included in the upcoming AEX Newsletter.

MV2 - Enhancements

Record selection panel in template-builder viewer has several bugs with regards to UI, reloading data, and re-rendering the data object button

The data object button will now re-render when a record is created. The data records will now reload when a record is created/updated. The scroll bar for the record selection panel is now visible. The populate button is no longer disabled when you're in the view data screen.

Template List in Modify Event Panel Missing Templates

An issue with templates not being included in the template list for Transaction Event configuration has been resolved. The issue was that after viewing a Transaction Event for a transaction and then viewing another one, the Transaction Event for the second transaction would show the templates from the first transaction.
